IT Design & Implementation

InfoTech Solutions creates IT systems that deliver increased reliability and productivity.

Our specialty is designing and installing intelligent infrastructure that optimises your business' digital function and drives high performance.

We can devise the scope of the project, source the necessary hardware and software for you at competitive prices and troubleshoot any teething problems.

Example projects

InfoTech's technicians can activate your standalone IT projects and see that everything runs smoothly.

Whether you want to start from scratch with a new server system, organise remote access or sync satellite offices, InfoTech Solutions can equip any business with corporate-level services.

- Server farm installation and maintenance
- Remote access roll-out
- Performance upgrades
- Sync satellite offices

How it works

1 · **Identifying what you need**

We talk through your business requirements to find out what kind of network and connectivity will suit you best. We'll figure out where improvements can be made in your current system and what your long-term future business goals are. An initial discussion may be enough to determine what you need or further fact-finding may be required. We may use network analysis software to give us an idea of traffic and user volume.

2 · **Designing your project**

Our team will create a network topology diagram supported by a comprehensive proposal. In most cases, we will present several 'back-up' options based on availability, reliability, security and cost. A list of pros and cons will be presented for each. This will give you all the information you need to make an informed decision.

3 · **Planning your roll-out**

Upgrading or transitioning to a new system requires careful planning to ensure minimal disruption. Our roll-out plan will take into account the everyday functions of your business and work around them as much as possible. We talk you through the plan, you give your feedback and discuss dates for commencement.

4 · **Implementation complete**

On the set date, our experienced engineers will carry out the plan efficiently and with minimal downtime to your business. This includes triple-testing systems and answering any questions your team may have.

A note on security and IP

Every InfoTech Solutions project must pass our strict in-house security tests before it reaches your premises.

Our career experts devise several back-up plans to clean data in case of corruption. Although we do everything we can to avoid a security compromise, we responsibly presume that failure is inevitable and have action plans ready to go if needed.

Longevity in the industry means we can handle every IT project or problem.
